Vontobel Fund II - Active Beta Opportunities AI

Multi Asset - Active Beta

This multi-asset fund aims to achieve steady value growth in the long term with a balanced risk profile. The fund invests worldwide mainly in equity, government bond, commodity and currency derivatives. Based on quantitative models, it systematically adapts its asset allocation to the risks and opportunities offered by the prevailing market conditions. The fund pursues a multi-model approach for the optimization of each asset class and relies on a state-dependent risk management. Through broad diversification across several identified risk premia the aim is to achieve largely stable performance in all market phases with the goal of participating in up-markets and limiting losses in down-markets across cycles. To promote environmental and social characteristics, the securities portfolio excludes corporates and sovereigns with an ESG rating below the defined minimum threshold. Furthermore, the fund invests at least 15% in green, social or sustainability bonds, either through direct investments or indirectly through funds that invest mainly in such bonds.

General Information

Investment Strategies

Risk Premium Eq

The equity market risk premium is the compensation an investor receives for assuming the systematic risk of an equity investment. It reflects the entrepreneurial risk associated with the stock market.

Risk Premium Fi

The risk premium in the bond market is caused by unexpected changes in the term structure of interest rates, which may be caused by inflation and shifts in market participants' preference for intertemporal consumption.

Risk Premium Co

The risk premium in the commodity futures markets is explored by a multi-strategy approach. The term premium is harvested with a market neutral strategy (BCOM ex-AL F6-F0), the market premium with a tactical allocation in BCOM exAL (F6).

Risk Premium Fx

The risk premium in currency markets is explored through tactical positions in eleven currencies using a multi-strategy approach. This involves individual, data-driven signals as well as trend-following, directional strategies.

Market commentary

The Iran conflict continued to drive markets on a day-to-day basis throughout May, with the diplomatic back-and-forth around a fragile ceasefire keeping investors in a state of uncertainty. Negotiations alternated between cautious progress and fresh breakdowns before a tentative memorandum of understanding was announced toward month-end, proposing to reopen the Strait of Hormuz and launching a 60-day negotiation window. The deal remained unsigned, leaving the outlook unresolved.

Against this backdrop, the most striking development was the decoupling of equities from the conflict narrative. The return of the AI trade drove the S&P 500 and Nasdaq to fresh record highs by month-end, with year-to-date gains of roughly 11% and 16% respectively. Fixed income told the opposite story: yields climbed to multi-year highs, with the 30-year US Treasury reaching 5.2%, its highest level since 2007, as the energy-driven inflation impulse forced central banks into an increasingly hawkish posture. The Fed held rates steady at its May meeting but the vote was unusually divided, and markets have now fully priced out any 2026 cut, with a hike becoming a possibility. The ECB and Bank of England similarly held their policy rates unchanged, with earlier easing expectations replaced by the prospect of tightening later in the year. In commodities, Brent crude fell below $100 per barrel for the first time since early in the conflict, as ceasefire optimism periodically gained traction, though oil remained some $50 above pre-war levels. Precious metals gave back, with gold trading around $4,500, well off its January all-time high near $5,600. In FX, the dollar ended May broadly steady, as residual safe-haven demand and the removal of Fed cut expectations offset the fading of the initial geopolitical risk premium.

This month’s outlook

It is still far from clear how large and how persistent the footprint of the oil supply shock on prices and inflation will prove to be, and central banks are unlikely to offer much guidance until that picture sharpens. Since month-end, the AI-powered equity rally that was the dominant market story throughout May has also come under pressure, raising the question of whether equities can continue to decouple from the broader uncertainty or whether some of the air is beginning to come out of what many have started to call the AI bubble.

For bonds, the economic weight is indicated in each case. The weights of the various maturity bands of a currency are scaled to the duration of the futures with the longest maturity. For German bonds, the duration of the Bund future is correspondingly decisive; for US bonds, the duration of the 10Y note is decisive.

Glossary

Benchmark
An index that is used to measure the performance of an investment fund with the purpose of tracking the return of such index or of defining the asset allocation of a portfolio or of computing the performance fees.

Duration (Modified Duration)
Duration is an indication of how much a bond's price could be affected by a change in interest rates.

Management Fee
Is a fee which covers all costs relating to possible services rendered in connection with investment management and distribution. Please refer to the fund’s prospectus for a complete description.

NAV
The Net Asset Value (NAV) represents the value per share. It is calculated by dividing the total net asset value of the fund (the value of the fund’s assets less its liabilities) by the number of shares outstanding.

Sharpe Ratio
The Sharpe ratio indicates the additional reward per unit of risk compared to a risk/free investment. It reveals how much performance was achieved at what level of risk.

TER
The fees and incidental costs charged on the management of collective investment schemes are to be disclosed using the internationally recognized Total Expense Ratio (TER). This ratio expresses the sum of all fees and incidental costs charged on an ongoing basis to the collective investment scheme’s assets (operating expenses) taken retrospec-tively as a percentage of the net assets.

Volatility
Volatility (or risk or standard deviation) is an indicator of the range of fluctuation of the annualized performance of a fund over a certain period.

Chances

+ Potential gains on invested capital through opportunities in global equity and bond markets
+ Use of equity index and government bond derivatives to enhance fund performance and earnings
+ Bond investments offer interest income and opportunities for capital gains in the event of a decline in market yields
+ Potential benefits of investing in liquid money market instruments that are less interest rate sensitive than longer-dated bonds

Risks

- The share value may fall below the purchase price at which the investor acquired his unit.
- The use of derivatives can generate additional risks (e.g. counterparty risk).
- Interest rates may fluctuate, bonds experience price losses as interest rates rise
- Market-related price fluctuations are possible
- foreign exchange risk
- Investments in money market instruments are associated with risks such as interest rate risk, inflation risk and economic instability.
